

Computer Hackers on the Lookout for Amazon Passwords

As the holiday shopping season begins, **hackers** are trying to trick users into revealing their private account information.

Last week, hackers tried to trick Amazon.com users into handing over their **passwords** and user names. Last holiday season, eBay and other online shopping websites were attacked.

The attempt to steal individual Amazon user names and **passwords** was a “**phishing**” attack. Phishing tries to trick users into thinking the request comes from the company.

In this case, **hackers** sent **email** to Amazon account holders. The **email** lied and claimed that 2,592 Amazon account records were stolen. Customers were asked to verify account information in the **phishing email**. The email’s signature was signed as "Amazon Customer Support."

Electronics and computer experts say deleting the email is an easy solution.

Amazon says thieves use hoax email that look like they are from Amazon company accounts. Amazon says many **phishing** emails contain misspelled words and bad grammar.

The company says it never asks for personal information, **passwords** or bank account numbers.
